

Acrison®

Dry Solids Metering and Handling

Technologically Superior High Performance Equipment

Since 1963, Acrison has been applying its skills to the art and science of dry solids metering and handling, successfully utilizing its expertise to effectively feed the countless number of diverse and unique materials that processors worldwide are routinely required to handle.

To meet these dry solids metering challenges, Acrison designed and developed a wide range of high performance, highly versatile metering mechanisms to accurately and reliably feed the broadest possible variety of dry solid materials, both on a volumetric and gravimetric basis.

Their extremely robust, heavy-duty designs and all-steel construction ensures durability and longevity even in the toughest industrial environments. And their minimal maintenance parameters result in the lowest overall cost-of ownership in the industry, delivering outstanding value over the life of the equipment. Feed rates range from a fraction of a pound upwards to 8000 cubic feet per hour.

Acrison also manufactures and/or will furnish various ancillary products to operate in conjunction with its core equipment, as a complete "packaged" metering and supply system.

Contact Acrison to arrange for an operational demonstration of the selected equipment handling your actual product(s), normally without charge or obligation.
