

BALDOR • RELIANCE®

DODGE®

Safer food comes from safer designs

Now more than ever, it's essential that your food processing operation runs efficiently, with full attention to food safety. Every process is critical to your success, and it's imperative that you specify the correct product for the intended application. Especially equipment subject to regular, intense cleaning methods.

ABB and Baldor-Reliance® motors and Dodge® mechanical power transmission products are designed around food industry sanitation standards with smooth, rounded surface textures, minimal crevices and proper sealing for ultimate reliability in zone one environments. Food safe products in a "zone one" area of the plant, direct contact with food area, should allow for easy and proper cleaning, reducing the risks of harboring bacteria and other contaminants. Our food safe products also undergo stringent testing to carry the IP69K for water ingress protection rating for the high pressure, high temperature cleaning methods. For the ultimate reliability in your food processing operation, specify food safe products in your zone one areas.
