

VOLUMETRIC PARTICULATE FILLERS

*The Multi-Product System: The Solution
You Would Expect From an Industry Leader*

The MPF fillers dispense clean, accurate portions of a wide variety of difficult-to-handle products such as cooked rice and pastas (long and short goods), cut vegetables and fruits, and ready-to-eat salads, as well as diced meats and seafood salads.

Increased profits and operation efficiency with flexibility

Our model MPFMP semi-automatic volumetric pocket filler is ideally suited for lower speed production lines, research and development labs, and pilot plant operations. It is rated at speeds up to 50-60 cpm, depending upon the product, volume to fill, container, line configuration, and operator.

Easy integration

The design and mobility of the units allow the fillers to be positioned directly over diverse production lines. They are compatible with a wide variety of container conveying systems for frozen and shelf-stable entrees, cartons, cups, pouches, cans, compartment trays, jars and many others.

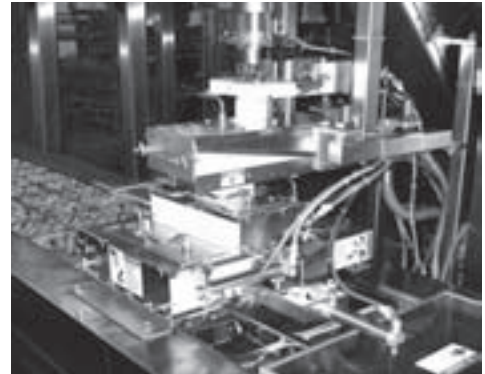

This mobile unit, like the MPFSC model, can be quickly cleaned and moved to a different production line in minutes, ready to fill a different product into a different container with no or few change parts.

- * Speeds up to 120 cpm per head depending on the model
- * Volumes from 36 to 2380 cc

Cleaning is surprisingly easy

DISTRIBUTION SYSTEMS

The MPF distribution system has been designed to distribute small dimensioned, hard to fill products such as cooked rice and pastas, vegetables, fruits and salads into various patterns.

From one discharge point (filler), the products are distributed into multiple lanes configurations (2 to 8 lanes) depending on the pattern chosen. The system can operate at up to 13 to 15 cycles per minute and deposit products into practically any type of containers such as pouches, plates, pies, etc.

The distribution systems can be installed and positioned over either a horizontal (intermittent motion) or vertical bagging machine.

And prompt service from technicians you can rely on

The Multi-Fill equipment offers dependability that only good design and workmanship can provide. The machines are backed by highly trained and knowledgeable service technicians, that understand the meaning of the word service.
